INSTALLATION AND CONFIGURATION OF LINUX

Aim:

To install and configure Linux operating system in a Virtual Machine.

Installation/Configuration Steps:

1. Install the required packages for virtualization
dnf install xen virt-manager qemu libvirt
2. Configure xend to start up on boot
systemctl enable virt-manager.service
3. Reboot the machine
Reboot
4. Create Virtual machine by first running virt-manager
virt-manager &
5. Click on File and then click to connect to localhost
6. In the base menu, right click on the localhost(QEMU) to create a new VM 7. Select Linux ISO image
8. Choose puppy-linux.iso then kernel version
9. Select CPU and RAM limits
10. Create default disk image to 8 GB
11. Click finish for creating the new VM with PuppyLinux

New VM

Create a new virtual machine

Step 1 of 5

Connection: QEMU/KVM

Choose how you would like to install the operating system

- ☒ Local install media (ISO image or CDROM)
- ☐ Network Install (HTTP, HTTPS, or FTP)
- ☐ Network Boot (PXE)
- ☐ Import existing disk image

► Architecture options

Cancel Back Forward

New VM

Create a new virtual machine

Step 1 of 5

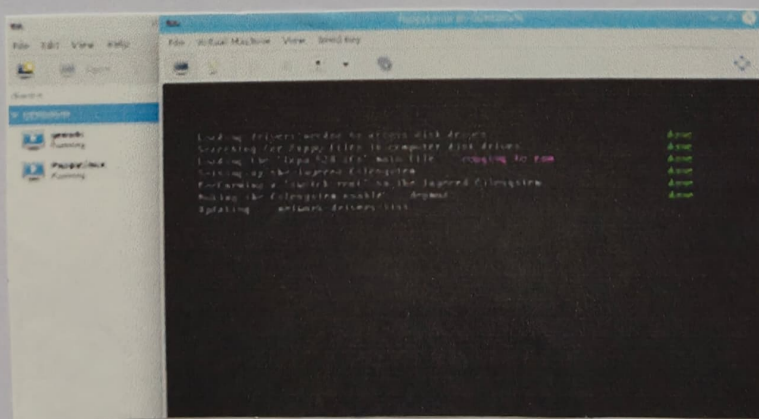

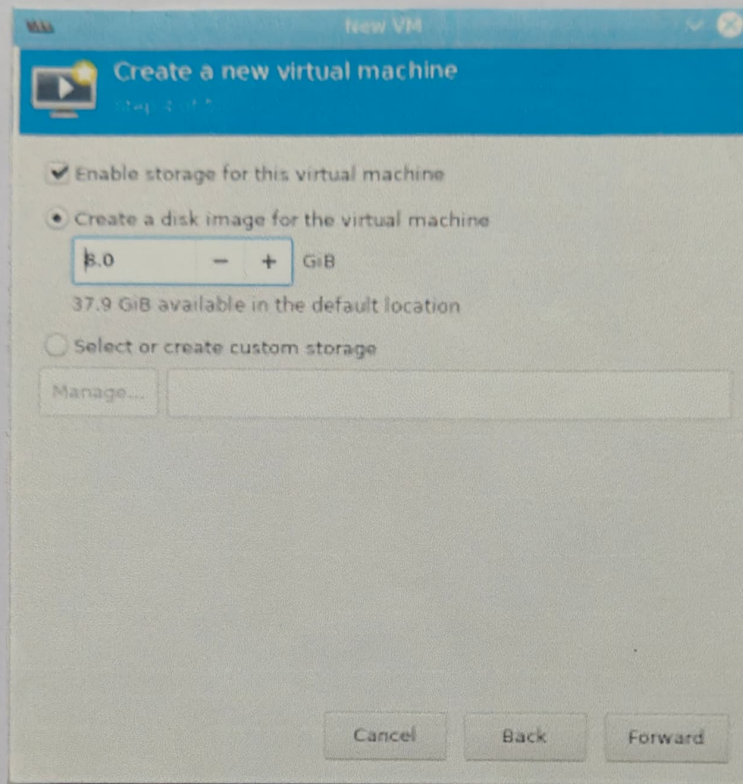

Choose Memory and CPU settings:

Memory: 1024 — +
Up to 1875 MB available on the host

CPU: 1 — +
Up to 2 available

Cancel Back Forward

Output:

Result :

Thus the installation of Fedora Linux OS in PC was installed successfully.
